Repeated-root pipeline: from the affine algebra to the exact joint enumerator
Affine algebra
$\mathcal{A} \cong \prod_s K_s$
$n = n' p^t$, $M = p^t$
$x^n - \lambda_s = (x^{n'} - \lambda_{s,0})^M$
Distinct factors
reciprocal orbits
(a_O, w_O)
Exponent words
$e_i \in \{0, \ldots, M\}$
min-edge statistic
Transfer matrix
$\mathrm{tr}((T_w^{(M)})^a)$
joint enumerator
LCD / SO / SD
moments, support
verification
